

Homework 7 - Project Stakeholders

1. Pharmacists

Status: Positive

Expectations / interests:

They want quick patient search, clear prescription details, automatic stock updates and alerts for low stock or near-expiry medicines. They also want less manual checking and fewer chances of dispensing the wrong medicine.

Possible conflicts or benefits:

The main benefit is faster and safer dispensing. A possible conflict is that they may lose trust in the system if it feels slow, unclear, or does not show the latest prescription changes clearly.

Team response:

Keep the pharmacist flow simple, make important information easy to see, and prioritize clear confirmation messages, real-time updates, and validation.

2. Suppliers / Medicine Distributors

Status: Neutral to positive

Expectations / interests:

They want accurate visibility of stock levels in pharmacies, timely updates when medicines are dispensed and alerts when inventory is low or near expiry. They are interested in smoother coordination with pharmacies to avoid stock shortages or overstocking.

Possible conflicts or benefits:

The benefit is better inventory management and fewer missed orders. A conflict could appear if the system's data is inaccurate, delayed or hard to integrate with their systems.

Team response:

Provide clear stock update APIs or notifications, simulate integration before going live and keep the system's stock tracking reliable and consistent.

3. Health Authorities (Ministry of Health)

Status: Neutral

Expectations / Interests:

They expect the system to ensure secure handling of sensitive health data, strict access control and full accountability regarding who accesses or modifies medical records. They are also interested in compliance with national healthcare regulations and standards.

Possible Conflicts or Benefits:

A major benefit is that a well-designed system can enhance data consistency, transparency and overall accountability across healthcare services. However, conflicts may arise if the system fails to meet privacy regulations, lacks sufficient security measures or mishandles sensitive patient information.

Team Response:

The team will integrate strong security mechanisms from the early stages of development, including role-based access control and encryption. Audit logs will be maintained to track all system activities and only essential data will be stored to minimize privacy risks.

4. Patients

Status: Positive

Expectations / Interests:

They want accurate prescriptions, clear instructions for medication use and confidence that they are receiving the correct medicine. They also expect their personal and medical data to be handled securely and privately.

Possible Conflicts or Benefits:

The benefit is increased safety and trust in the pharmacy service. A possible conflict could occur if there are errors in prescriptions, delays in service or concerns about data privacy.

Team Response:

Ensure prescription accuracy through validation, keep patient-related information clear and readable, and apply strong data protection measures to maintain privacy and trust.
